innuPREP Blood DNA Mini Kit - FX

The innuPREP Blood DNA Mini Kit - FX has been designed for automated extraction of genomic DNA (gDNA) from whole blood preparations including fresh or frozen whole blood samples stabilized with EDTA, citrate or heparin and even collected in PAXgene® Blood DNA Tubes. The extraction protocol is established on CyBio FeliX based on sample volumes of up to 400 µl. The extraction process is based on binding the nucleic acids to magnetic particles.

The procedure starts with the lysis of the starting material. After washing steps the nucleic acid is eluted from the magnetic particles with RNase-free water. The protocol is optimized to obtain DNA of maximum yield and quality which can be used for downstream applications like standard or real-time PCR. The extraction procedure is based on the special technology patented by IST Innuscreen.

In order to minimize manual preparation steps for this kit, the innuPREP Pre-filling Set (OL3317-25-127 available at Analytik Jena) offers the possibility of automated pre-filling of all Deep Well Plates with respective buffers and reagents by the CyBio FeliX.

Product Name: innuPREP Blood DNA Mini Kit - FX

Product details

High Throughput Device: CyBio FeliX

Extract: DNA

Reactions: 96 or 480 (CyBio FeliX)

Sample type/Starting material: Blood, fresh or frozen

Stabilizers: EDTA or citrate

PAXgene® Blood DNA Tubes

Specifications:

Automated procedure including lysis

High-throughput application for up to 96 samples in parallel

Diverse starting material: fresh or frozen whole blood samples stabilized with EDTA,

citrate, heparin or collected in PAXgene® Blood DNA Tubes

Flexible application: protocol for 200 µl and 400 µl

High yield and high purity DNA

Starting material

Up to 400 µl whole blood

Fresh or frozen blood

Stabilized with EDTA, citrate or heparin

PAXgene® Blood DNA Tubes

Average yield

Depending on sample quality/amount of mononuclear blood cells

200 µl whole blood approx. 2 - 8 µg

400 µl whole blood approx. 2 - 12 µg

Extraction time

Up to 200 µl whole blood: 70 min

Up to 400 µl whole blood: 86 min

Average purity

1.8 - 2.0
